How to Trade Stock Options - Principles to Options 101

Stock options are financial instruments that give you the right, but not the obligation, to buy (Call options) or sell (Put options) a stock at a predetermined price (strike price) before a specific date (expiration date). Understanding key terms is crucial: the strike price is where you can buy or sell the stock, the expiration date is the deadline for the option, and the premium is the cost of purchasing the option. [Show more](#) To trade options effectively, start by choosing a strategy based on your goals. For instance, a Covered Call involves holding the underlying stock while selling a call option to generate income, while a Protective Put involves buying a put option to limit potential losses on a stock you own. Risk management is essential. Options can be volatile, so use tools like stop-loss orders and trade only with money you can afford to lose. Practice with paper trading platforms to hone your skills without financial risk. Finally, staying informed about market trends and news will help you make better trading decisions. Options trading requires both knowledge and experience, so take the time to learn and practice.
